

SUMMARY

Full-stack engineer with 5+ years of TypeScript experience, the last 3+ building a production anti-phishing platform at PhishFort. I build client-facing products (dashboards, real-time views) and the data layers underneath them — including a zero-downtime migration of large Firestore datasets to Cloudflare D1 and query optimizations that took enterprise views from timeouts to sub-second loads. Helped cut phishing takedown time by ~30%.

Key impact: 3M+ records migrated with zero downtime · enterprise views from timeouts to sub-second loads · ~30% faster phishing takedowns

SKILLS

Frontend — React · Next.js · TypeScript · React Query · Zustand · Tailwind CSS · shadcn/ui **Backend** — Node.js · NestJS · Express · tRPC · Prisma · PostgreSQL · Cloudflare D1 · MongoDB

Cloud / DevOps — Cloudflare (Workers, D1, Containers) · GCP (Cloud Run, Cloud Storage) · Firebase · Docker · CI/CD · Git **AI** — Claude Code / Codex agentic workflows

EXPERIENCE

Full-Stack Software Engineer — PhishFort (anti-phishing platform)

Remote · Apr 2023 – Jun 2026

- **Designed and owned two production NestJS service layers:** a general data layer on GCP Cloud Run consumed by every team in the company, and a Cloudflare-deployed service (Workers + Containers) in front of our D1 databases — the sole read path for the client dashboard.
- **Migrated 3M+ records from Firestore to D1.** When we moved off Firebase — mainly due to query-speed and scalability issues — our team executed the largest migration, which spanned multiple sub-collections and required a long, careful cutover with zero downtime and zero data loss.
- **Fixed loading times for our largest enterprise clients.** I replaced a query fan-out that hit platform limits with a single database call resolving a client's full sub-account tree at any depth — from timeouts to sub-second loads. (recursive CTE)
- **Built a new client-facing dashboard** (Next.js, tRPC) giving brands real-time visibility into every phishing incident and report. We rebuilt it on a modern stack to be beautiful and fast, integrating live @mentions for communication, smart reporting, and more — to which I contributed on both frontend and backend.
- **Co-built Payne.** Early in my time at the company, I helped improve Payne, the analyst incident-management dashboard (unified priority queue with auto-triage and assignment). I improved React Query usage for performance and cache efficiency and owned multiple new pages, frontend and backend, before moving to another team.
- **Shipped NightHawk,** a cross-browser anti-phishing extension for the crypto community that grew to **2,000+ installs.** I maintained this outsourced project — a new tech stack for me at the time — quickly understood how browser extensions work, and made security improvements to honor user-data privacy, plus major backend improvements: caching, rate limiting, auth hardening.
- **Built a direct-to-storage upload path** for large evidence files using GCP presigned URLs. This fixed failed uploads that exceeded serverless request-size limits — mostly a Next.js limitation.

Full-Stack Developer — Addis Software PLC

Addis Ababa · Aug 2019 – Dec 2022

- **Built Behiwot,** an event-planning platform, and delivered its backend and frontend in a short time.
- **Built secure Node.js / Express APIs** and integrated local and international payments. I helped build a Node.js library for a local payment provider — one of the first in the JS ecosystem — and maintained it until the payment system merged it with other open-source libraries. Also improved state management (Redux-Saga) and MongoDB aggregations with Mongoose.

EDUCATION & CERTIFICATIONS

B.Sc. in Computer Science & Engineering — Adama Science and Technology University

2015 – 2019

AWS Fundamentals: Building Serverless Applications

Coursera
