

Daniel Demelash (Demissie)

Full-Stack Software Engineer — Cloudflare Edge / Serverless & Security

Addis Ababa, Ethiopia (GMT+3) · danielddemissie@gmail.com

github.com/danielddemissie · linkedin.com/in/danielddemissie · dani-deme.vercel.app

SUMMARY

Full-stack software engineer with 3+ years of professional experience building production cybersecurity systems on the edge. At PhishFort, owned and shipped core infrastructure across a multi-service anti-phishing platform — migrating millions of records to Cloudflare D1, building the client-facing dashboard, and contributing to analyst tooling that cut end-to-end takedown time roughly in half. Specializes in the rare combination of edge/serverless engineering (Cloudflare Workers, D1, tRPC) and applied security, with a modern AI-augmented (agentic) development workflow. TypeScript end to end; comfortable owning a feature from data model to UI.

SKILLS

Specialties: Edge & Serverless (Cloudflare Workers, D1, Pages, Wrangler) · Applied security / anti-phishing & fraud prevention · Type-safe API design (tRPC, REST) · Multi-service architecture · Data migration at scale

Frontend: React · Next.js · TypeScript · Redux / Redux-Saga · React Query · Tailwind CSS · shadcn/ui

Backend: Node.js · NestJS · Express · Prisma · PostgreSQL · Cloudflare D1 · MongoDB · Socket.io

Cloud / DevOps: Cloudflare · GCP · Firebase · AWS · Docker · CI/CD · Git

AI-Augmented Engineering: Agentic coding workflows (Claude Code, Hermes) · secure sandboxed agent execution (Docker isolation) · plan-then-build SDLC · reusable skill authoring · LLM/AI-SDK integration

EXPERIENCE

Full-Stack Software Engineer — PhishFort

Remote · April 2023 – June 2026

Commercial cybersecurity platform that detects and takes down phishing sites, mobile-app clones, and fake social content — protecting brands, customers, and revenue. Owned features across a multi-service architecture (customer dashboard, edge service layer, analyst tooling, browser extension).

Performance & data migration

- Owned the migration of a **3M+ incident-history sub-collection** — along with **100K+ attachments and 60K+ documents** — from a legacy Firebase→Postgres JSON-sync pipeline to **Cloudflare D1** (structured SQL). Large-client history that previously lagged now renders near-instantly, directly resolving a live customer-facing performance issue.
- Migrated the customer dashboard's read paths off a legacy Postgres backend onto a **Cloudflare Worker edge service layer** that materializes data from multiple upstream security backends behind a unified D1 mirror.

Client-facing dashboard

- Built the **client-facing dashboard** (incident stats, views, and reporting) in Next.js/tRPC, giving clients real-time visibility into their incidents.
- Built **real-time feedback loops** (email + in-app @mention notifications) so clients get incident updates and required-action requests instantly instead of waiting on analysts.

Analyst tooling & takedown speed

- Contributed to the **analyst incident-management dashboard** — a unified priority queue that automatically triages and assigns incidents — and to **AI-assisted case-triage** that auto-classifies incident type and validates evidence sufficiency at submission; this work **cut end-to-end takedown time by roughly 50%**.

Browser extension (NightHawk)

- Designed and shipped **NightHawk**, a cross-browser extension protecting the cryptocurrency community from phishing; **grew to 2,000+ Chrome installs**, letting users and analysts report phishing sites directly from the browser (sunset when sponsorship ended).

Supporting services

- Built and maintained supporting edge services — a data-mirroring pipeline syncing records across backends and a file-upload proxy — keeping data consistent across the platform's multiple backends.
- Worked across the full stack in **TypeScript** — Cloudflare Workers, D1, tRPC, React/Next.js, and NestJS.

Full-Stack Developer (Freelance) — Utentic

Remote · 2022

Travel-community startup connecting travelers with curated trip groups.

- Built scalable REST APIs in **Node.js / Express**; designed back-end services and front-end UI components.

Software Engineer (Intern) — Addis Software PLC

Addis Ababa, Ethiopia · 2022

Software & IT company serving clients nationwide and worldwide.

- Contributed to the design and architecture of **Behiwot**, an event-planning platform; converted complex Figma designs into clean, maintainable **React**.
- Built secure **Node.js / Express** APIs, integrated local + international payments, and improved state management (Redux/Redux-Saga) and MongoDB aggregations.

AI-AUGMENTED (AGENTIC) ENGINEERING

Practising engineer in agentic development — using autonomous coding agents to ship faster without sacrificing safety or review discipline.

- Run **Claude Code** and **Hermes** as daily coding agents, with a **security-isolated Docker sandbox** so agents execute against the codebase without exposing host credentials or environment.
- Operate a **plan-then-build SDLC**: agents draft a written plan, the plan is reviewed, then execution proceeds — keeping AI output auditable and on-spec.
- Author **reusable skills** (procedural playbooks) so recurring tasks run consistently.

SELECTED PERSONAL PROJECTS

- **pr-desc** — AI-powered CLI generating PR descriptions & Conventional Commit messages from git diffs. (TypeScript, AI-SDK, Commander) · ★5
- **Awrraris** — zero-setup CLI music-streaming app; runs out-of-the-box, no Node.js install required. (TypeScript, Puppeteer, yt-dlp)
- **birr-verify** — mobile app to verify transactions across Ethiopian mobile-banking apps. (React Native, Expo, Supabase)
- **Chapa SDK (unofficial)** — TypeScript SDK for the Chapa payment gateway. ★4

EDUCATION

B.Sc. in Computer Science & Engineering — Adama Science and Technology University · 2018 – 2023

CERTIFICATIONS

AWS Fundamentals: Building Serverless Applications — Coursera
